

DOVA FUTURES INTELLIGENCE

Build Handoff Package

Source: MARK XXXIX-OR prototype

Destination: <https://github.com/Dblackone/Dova-futures>

Workspace path: `workspaces/dova-futures-intelligence/`

MOVE INSTRUCTION

Move this entire folder into:

`Dova-futures/workspaces/dova-futures-intelligence/`

Do not place it at the Dova-futures repository root. The root is the live marketing website, and `dova-preorder/` is deploy-critical.

WHAT IS BUILT

- Shared contracts for requests, tools, plans, providers, approvals, events, and memory queries.
- Capability registry with required-input validation.
- Policy engine that blocks high-impact actions until approval.
- Workspace-scoped filesystem listing and controlled text writing.
- Provider metadata and fallback routing with a deterministic mock provider.
- Headless interaction gateway for desktop, voice, and API channels.
- Prototype UI bridge: `/core list [path]` and `/core write <path> <content>`.
- Architecture, decisions, capability inventory, project, and handoff documents.
- 18 dependency-free automated tests.

VERIFY

From this workspace run:

```
python -m unittest discover -s tests -v
```

Expected: 18 tests passing.

Never commit `config/api_keys.json`, `.env`, `memory/long_term.json`, or generated runtime files.

KNOWN LIMITATIONS

- Natural-language planning is not yet connected to the new core.
- The UI has no approval button yet, so writes stop safely at approval.
- Existing actions still use legacy direct dispatch.
- `actions.cmd_control` is referenced but absent; keep it unavailable until reviewed.
- Live Gemini, OpenRouter, and LM Studio adapters are not yet connected.
- Durable tasks, audit persistence, layered memory, and domain agents are future milestones.

NEXT

1. Register the workspace in the Dova-futures project registry.
2. Read CLAUDE.md and governance/agents/SHARED-RULES.md in the destination repo.
3. Add approval controls to the desktop UI.
4. Migrate one read-only file_controller capability.
5. Add audit persistence and the first live provider adapter.

Continue from this state. Do not restart the architecture or move this project into the destination repository root.
